Degree Program: BSc (Hons) Software Engineering

This project was developed in order to address the challenges faced by Sri Lankan users who use international print-on-demand platforms. These platforms require global payment methods like PayPal, not beginner-friendly and take longer time for shipping and have custom issues. As a result, local users find it hard to start or manage their own design business. After a study of existing platforms, it proved that existing platforms do not offer start-to-end free services. They lack proper localization and require paid subscriptions or a third-party integration. Designers cannot engage with customers directly through a single platform. On the customers' side, they prefer to see how a design would look on them before purchasing. But most websites don't let you "virtually try on" a cloth. As a result, an all-in-one platform was much required for the local users. To achieve this shortcoming, a web-based platform Cre8tify, was developed to solve all these issues by being a local platform that has real-time Design Editor, free Live Preview on users' image and a 360° Dummy Preview to enhance visualization and use Sri Lankan payment gateways. The product went through formal testing for function, usability, and performance to verify its reliability and efficiency. The test showed that all core functions performed as designed, the design editor, preview modules, and transaction flow. Users were able to create designs and purchase products with little difficulty, proving that this platform is easy to use. In addition, this platform performed steadily on multiple devices and screen sizes and loading times were reasonable under average usage. In conclusion, the results of this study have shown that a localized platform, such as Cre8tify, can successfully provide an accessible, user-friendly and practical answer to existing system limitations in the Sri Lankan market.

Keywords: custom t-shirt design, e-commerce, 360° dummy preview, localization, user-designer collaboration.
